
Preface

This text is intended for researchers interested in the application of feedback and control to biomolecular systems. The material has been designed so that it can be used in parallel with the textbook *Feedback Systems* [1] as part of a course on biomolecular feedback and control systems, or as a stand-alone reference for readers who have had a basic course in feedback and control theory. The full text for this book, along with additional supplemental material, is available on a companion Web site:

<http://press.princeton.edu/titles/10285.html>

The material in this book is intended to be useful to three overlapping audiences: graduate students in biology and bioengineering interested in understanding the role of feedback in natural and engineered biomolecular systems; advanced undergraduates and graduate students in engineering disciplines who are interested in the use of feedback in biological circuit design; and established researchers in the biological sciences who want to explore the potential application of principles and tools from control theory to biomolecular systems. We have written the text assuming some familiarity with basic concepts in feedback and control, but have tried to provide insights and specific results as needed, so that the material can be learned in parallel. We also assume some familiarity with cell biology, at the level of a first course for non-majors. The individual chapters in the text indicate the prerequisites in more detail, most of which are covered either in Åström and Murray [1] or in the supplemental information available from the companion Web site.

Acknowledgments. Many colleagues and students provided feedback and advice on the book. We would particularly like to thank Mustafa Khammash, Eric Klavins, and Eduardo Sontag, who gave detailed comments on some of the early versions of the text. In addition, we would like to acknowledge Abdullah Amadeh, Andras Gyorgy, Narmada Herath, Yutaka Hori, Shridhar Jayanthi, Scott Livingston, Rob Phillips, Yili Qian, Phillip Rivera, Vipul Singhal, Anandh Swaminathan, Eric Winfree, and Enoch Yeung for their support and comments along the way. Finally, we would like to thank Caltech, MIT and the University of Michigan for providing the many resources that were necessary to bring this book to fruition.
